Appendix F

How to Disable Core File Dumping

Because of the length of time it takes, a large core file dump may cause the **`ts-daemon`** to appear to hang. The person running the program can set an environment variable to prohibit core dumps:

```
$ setenv CM_NO_PN_CORE 1
```

To re-enable core file dumping, unset the environment variable:

```
$ unsetenv CM_NO_PN_CORE
```

Another way to prevent core file dumping is for the user to place the line **`limit coredumpsize 0`** in his or her **`.cshrc`** file. To re-enable core file dumping, remove the line from the **`.cshrc`** file. (Trying to limit the size of a core-file dump by specifying **`limit coredumpsize`** *x*, where $x > 0$, does not work.)
